# Propositional Logic

**Proposition:** a **declarative** sentence that is **either true or false (not both)**.

- Conventional letters used for propositional variables are  $p, q, r, s, \dots$
- **Truth value** of a proposition: true, denoted by T; false, denoted by F.

Compound propositions are build using **logical connectives**:

- Negation  $\neg$
- Conjunction  $\wedge$
- Disjunction  $\vee$
- Exclusive or  $\oplus$
- Implication  $\rightarrow$
- Biconditional  $\leftrightarrow$

# Tautology and Logical Equivalences

- **Tautology**: A compound proposition that is **always true**, no matter what the truth values of the propositional variables that occur in it.
  - ▶ E.g.,  $p \vee \neg p$
- **Contradiction**: A compound proposition that is always false.

The compound propositions  $p$  and  $q$  are called **logically equivalent**, denoted by  $p \equiv q$ , if  $p \leftrightarrow q$  is a tautology.

- E.g.,  $\neg(p \vee q)$  and  $\neg p \wedge \neg q$

That is, two compound propositions are equivalent if they always have the same truth value.

Determine logically equivalent propositions using:

- Truth table
- Logical Equivalences

# Important Logical Equivalences

| <i>Equivalence</i>   | <i>Name</i>         |
|--|---------------------|
| $p \wedge \mathbf{T} \equiv p$<br>$p \vee \mathbf{F} \equiv p$   | Identity laws       |
| $p \vee \mathbf{T} \equiv \mathbf{T}$<br>$p \wedge \mathbf{F} \equiv \mathbf{F}$   | Domination laws     |
| $p \vee p \equiv p$<br>$p \wedge p \equiv p$   | Idempotent laws     |
| $\neg(\neg p) \equiv p$  | Double negation law |
| $p \vee q \equiv q \vee p$<br>$p \wedge q \equiv q \wedge p$   | Commutative laws    |
| $(p \vee q) \vee r \equiv p \vee (q \vee r)$<br>$(p \wedge q) \wedge r \equiv p \wedge (q \wedge r)$                     | Associative laws    |
| $p \vee (q \wedge r) \equiv (p \vee q) \wedge (p \vee r)$<br>$p \wedge (q \vee r) \equiv (p \wedge q) \vee (p \wedge r)$ | Distributive laws   |
| $\neg(p \wedge q) \equiv \neg p \vee \neg q$<br>$\neg(p \vee q) \equiv \neg p \wedge \neg q$                             | De Morgan's laws    |
| $p \vee (p \wedge q) \equiv p$   | Absorption laws     |

# Predicate Logic and Quantified Statements

**Predicate Logic:** make statements with **variables**:  $P(x)$ .

Propositional function  $P(x) \xrightarrow{\text{specify } x} \text{Proposition}$

**Quantified Statements:** Universal quantifier  $\forall x P(x)$ ; Existential quantifier  $\exists x P(x)$

| Statement        | When true?                                  | When false?                            |
|------------------|---|--|
| $\forall x P(x)$ | $P(x)$ true for all $x$                     | There is an $x$ where $P(x)$ is false. |
| $\exists x P(x)$ | There is some $x$ for which $P(x)$ is true. | $P(x)$ is false for all $x$ .          |

Propositional function  $P(x) \xrightarrow{\text{for all/some } x \text{ in domain}} \text{Proposition}$

# Negation and Nest Quantifier

| Negation              | Equivalent Statement  | When Is Negation True?                     | When False?                               |
|-----------------------|-----------------------|--|---|
| $\neg \exists x P(x)$ | $\forall x \neg P(x)$ | For every $x$ , $P(x)$ is false.           | There is an $x$ for which $P(x)$ is true. |
| $\neg \forall x P(x)$ | $\exists x \neg P(x)$ | There is an $x$ for which $P(x)$ is false. | $P(x)$ is true for every $x$ .            |

| <i>Statement</i>   | <i>When True?</i>   | <i>When False?</i>   |
|--|---|--|
| $\forall x \forall y P(x, y)$<br>$\forall y \forall x P(x, y)$ | $P(x, y)$ is true for every pair $x, y$ .                   | There is a pair $x, y$ for which $P(x, y)$ is false.         |
| $\forall x \exists y P(x, y)$                                  | For every $x$ there is a $y$ for which $P(x, y)$ is true.   | There is an $x$ such that $P(x, y)$ is false for every $y$ . |
| $\exists x \forall y P(x, y)$                                  | There is an $x$ for which $P(x, y)$ is true for every $y$ . | For every $x$ there is a $y$ for which $P(x, y)$ is false.   |
| $\exists x \exists y P(x, y)$<br>$\exists y \exists x P(x, y)$ | There is a pair $x, y$ for which $P(x, y)$ is true.         | $P(x, y)$ is false for every pair $x, y$ .                   |

# Validity of Argument Form:

The **argument form** with premises  $p_1, p_2, \dots, p_n$  and conclusion  $q$  is **valid**, if

$(p_1 \wedge p_2 \wedge \dots \wedge p_n) \rightarrow q$  is a **tautology**.

Note: According to the definition of  $p \rightarrow q$ , we do not worry about the case where  $p_1 \wedge p_2 \wedge \dots \wedge p_n$  is false.

# Rules of Inference for Propositional Logic

| <i>Rule of Inference</i>   | <i>Tautology</i>   | <i>Name</i>            |
|--|--|------------------------|
| $\begin{array}{l} p \\ p \rightarrow q \\ \hline \therefore q \end{array}$                             | $(p \wedge (p \rightarrow q)) \rightarrow q$                                 | Modus ponens           |
| $\begin{array}{l} \neg q \\ p \rightarrow q \\ \hline \therefore \neg p \end{array}$                   | $(\neg q \wedge (p \rightarrow q)) \rightarrow \neg p$                       | Modus tollens          |
| $\begin{array}{l} p \rightarrow q \\ q \rightarrow r \\ \hline \therefore p \rightarrow r \end{array}$ | $((p \rightarrow q) \wedge (q \rightarrow r)) \rightarrow (p \rightarrow r)$ | Hypothetical syllogism |
| $\begin{array}{l} p \vee q \\ \neg p \\ \hline \therefore q \end{array}$                               | $((p \vee q) \wedge \neg p) \rightarrow q$                                   | Disjunctive syllogism  |

|   |   |                |
|---|---|----------------|
| $\begin{array}{l} p \\ \hline \therefore p \vee q \end{array}$        | $p \rightarrow (p \vee q)$                  | Addition       |
| $\begin{array}{l} p \wedge q \\ \hline \therefore p \end{array}$      | $(p \wedge q) \rightarrow p$                | Simplification |
| $\begin{array}{l} p \\ q \\ \hline \therefore p \wedge q \end{array}$ | $((p) \wedge (q)) \rightarrow (p \wedge q)$ | Conjunction    |

# Methods of Proving Theorems

A proof is a **valid argument** that establishes the truth of a mathematical statement.

- **Direct proof**

$p \rightarrow q$  is proved by showing that if  $p$  is true then  $q$  follows

- **Proof by contrapositive**

show the contrapositive  $\neg q \rightarrow \neg p$

- **Proof by contradiction**

show that  $(p \wedge \neg q)$  contradicts the assumptions

- **Proof by cases**

give proofs for all possible cases

- **Proof of equivalence**

$p \leftrightarrow q$  is replaced with  $(p \rightarrow q) \wedge (q \leftarrow p)$

# Proof Exercises

Prove that  $\sqrt{2}$  is **irrational**. (Rational numbers are those of the form  $\frac{m}{n}$ , where  $m$  and  $n$  are integers.)

Prove that there are infinitely many prime numbers.

Show that there exist irrational numbers  $x$  and  $y$  such that  $x^y$  is rational.

# Sets

A set is an **unordered collection of objects**.

- listing (enumerating) the elements
- if enumeration is hard, use ellipses (...)
- definition by property, using the set builder

$$\{x \mid x \text{ has property } P \text{ or property } P(x)\}$$

## Proof of Subset:

- Showing  $A \subseteq B$ : if  $x$  belongs to  $A$ , then  $x$  also belongs to  $B$ .
- Showing  $A \not\subseteq B$ : find a single  $x \in A$  such that  $x \notin B$ .

Prove  $A = B$ ?

# Cardinality, Power Set, Tuples, and Cartesian Product

**Cardinality:** If there are exactly  $n$  **distinct** elements in  $S$ , where  $n$  is a nonnegative integer, we say that  $S$  is a finite set and  $n$  is the cardinality of  $S$ , denoted by  $|S|$ .

**Power Set:** Given a set  $S$ , the **power set** of  $S$  is the **set of all subsets** of the set  $S$ , denoted by  $\mathcal{P}(S)$ .

**Tuples:** The **ordered  $n$ -tuple**  $(a_1, a_2, \dots, a_n)$  is the **ordered** collection that has  $a_1$  as its first element and  $a_2$  as its second element and so on.

**Cartesian Product:** Let  $A$  and  $B$  be sets. The **Cartesian product** of  $A$  and  $B$ , denoted by  $A \times B$ , is the set of all ordered pairs  $(a, b)$ , where  $a \in A$  and  $b \in B$ :

$$A \times B = \{(a, b) \mid a \in A \wedge b \in B\}$$

# Set Operations

**Union:** Let  $A$  and  $B$  be sets. The union of the sets  $A$  and  $B$ , denoted by  $A \cup B$ , is the set  $\{x \mid x \in A \vee x \in B\}$ .

**Intersection:** The intersection of the sets  $A$  and  $B$ , denoted by  $A \cap B$ , is the set  $\{x \mid x \in A \wedge x \in B\}$ .

**Complement:** If  $A$  is a set, then the complement of the set  $A$  (with respect to  $U$ ), denoted by  $\bar{A}$  is the set  $U - A$ ,  $\bar{A} = \{x \in U \mid x \notin A\}$

**Difference:** Let  $A$  and  $B$  be sets. The difference of  $A$  and  $B$ , denoted by  $A - B$ , is the set containing the elements of  $A$  that are not in  $B$ .  
 $A - B = \{x \mid x \in A \wedge x \notin B\} = A \cap \bar{B}$ .

Principle of inclusion-exclusion:  $|A \cup B| = |A| + |B| - |A \cap B|$

# Set Identities

|  |                     |
|--|---------------------|
| $A \cap U = A$<br>$A \cup \emptyset = A$   | Identity laws       |
| $A \cup U = U$<br>$A \cap \emptyset = \emptyset$   | Domination laws     |
| $A \cup A = A$<br>$A \cap A = A$   | Idempotent laws     |
| $\overline{(\overline{A})} = A$  | Complementation law |
| $A \cup B = B \cup A$<br>$A \cap B = B \cap A$   | Commutative laws    |
| $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$<br>$A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$             | Associative laws    |
| $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$<br>$A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$             | Distributive laws   |
| $\overline{A \cap B} = \overline{A} \cup \overline{B}$<br>$\overline{A \cup B} = \overline{A} \cap \overline{B}$ | De Morgan's laws    |
| $A \cup (A \cap B) = A$<br>$A \cap (A \cup B) = A$   | Absorption laws     |

# Proof of Set Identities

Prove that  $\overline{A \cap B} = \bar{A} \cup \bar{B}$

**Proof 1:** using membership tables.

**Proof 2:** by showing that  $\overline{A \cap B} \subseteq \bar{A} \cup \bar{B}$  and  $\bar{A} \cup \bar{B} \subseteq \overline{A \cap B}$

**Proof 3:** Using set builder and logical equivalences

|  |   |
|--|---|
| $\overline{A \cap B} = \{x \mid x \notin A \cap B\}$ | by definition of complement                         |
| $= \{x \mid \neg(x \in (A \cap B))\}$                | by definition of does not belong symbol             |
| $= \{x \mid \neg(x \in A \wedge x \in B)\}$          | by definition of intersection                       |
| $= \{x \mid \neg(x \in A) \vee \neg(x \in B)\}$      | by the first De Morgan law for logical equivalences |
| $= \{x \mid x \notin A \vee x \notin B\}$            | by definition of does not belong symbol             |
| $= \{x \mid x \in \bar{A} \vee x \in \bar{B}\}$      | by definition of complement                         |
| $= \{x \mid x \in \bar{A} \cup \bar{B}\}$            | by definition of union                              |
| $= \bar{A} \cup \bar{B}$                             | by meaning of set builder notation                  |

# Function

Let  $A$  and  $B$  be two sets. A **function** from  $A$  to  $B$ , denoted by  $f : A \rightarrow B$ , is an assignment of **exactly one** element of  $B$  to **each** element of  $A$ .

- **One-to-one (injective) function:**

- ▶ A function  $f$  is called **one-to-one** or **injective** if and only if  $f(x) = f(y)$  **implies**  $x = y$  for all  $x, y$  in the domain of  $f$ .

- **Onto (surjective) function:**

- ▶ A function  $f$  is called **onto** or **surjective** if and only if for **every**  $b \in B$  there is an element  $a \in A$  such that  $f(a) = b$ .

- **One-to-one (bijective) correspondence**

- ▶ One-to-one and onto

# Proof for One-to-One and Onto

Suppose that  $f : A \rightarrow B$ .

|   |   |
|---|---|
| To show that $f$ is <i>injective</i>      | Show that if $f(x) = f(y)$ for all $x, y \in A$ , then $x = y$                                    |
| To show that $f$ is not <i>injective</i>  | Find <b>specific</b> elements $x, y \in A$ such that $x \neq y$ and $f(x) = f(y)$                 |
| To show that $f$ is <i>surjective</i>     | Consider an <b>arbitrary</b> element $y \in B$ and find an element $x \in A$ such that $f(x) = y$ |
| To show that $f$ is not <i>surjective</i> | Find a <b>specific</b> element $y \in B$ such that $f(x) \neq y$ for all $x \in A$                |

# Inverse Function and Composition of Functions

**Inverse function:** Let  $f$  be a **one-to-one correspondence (bijection)** from the set  $A$  to the set  $B$ . The **inverse function** of  $f$  is the function that assigns to an element  $b$  belonging to  $B$  the unique element  $a$  in  $A$  such that  $f(a) = b$ .

Let  $f$  be a function from  $B$  to  $C$  and let  $g$  be a function from  $A$  to  $B$ . The **composition** of the functions  $f$  and  $g$ , denoted by  $f \circ g$ , is defined by  $(f \circ g)(x) = f(g(x))$ .

The **floor function** assigns a real number  $x$  the **largest integer that is  $\leq x$** , denoted by  $\lfloor x \rfloor$ . E.g.,  $\lfloor 3.5 \rfloor = 3$ .

The **ceiling function** assigns a real number  $x$  the **smallest integer that is  $\geq x$** , denoted by  $\lceil x \rceil$ . E.g.,  $\lceil 3.5 \rceil = 4$ .

# Sequences

A **sequence** is a **function** from a subset of the set of integers (typically the set  $\{0, 1, 2, \dots\}$  or  $\{1, 2, 3, \dots\}$ ) to a set  $S$ .

We use the notation  $a_n$  to denote the image of the integer  $n$ .  $\{a_n\}$  represents the ordered list  $\{a_1, a_2, a_3, \dots\}$

**Recursively Defined Sequences:** provide

- One or more **initial terms**
- A **rule** for determining **subsequent terms** from those that precede them.

# Cardinality of Sets

A set that is either **finite** or has the **same cardinality** as the set of positive integers  $\mathbb{Z}^+$  is called **countable**.

If there is a **one-to-one function** from  $A$  to  $B$ , the cardinality of  $A$  is **less than or equal to** the cardinality of  $B$ , denoted by  $|A| \leq |B|$ .

**Theorem:** If there is a **one-to-one correspondence** between elements in  $A$  and  $B$ , then the sets  $A$  and  $B$  have the **same cardinality**.

**Theorem:** If  $A$  and  $B$  are sets with  $|A| \leq |B|$  and  $|B| \leq |A|$ , then  $|A| = |B|$ .

# Big-O Notation

Let  $f$  and  $g$  be functions from the set of integers or the set of real numbers to the set of real numbers. We say that  $f(x)$  is  $O(g(x))$  if there are constants  $C$  and  $k$  such that

$$|f(x)| \leq C|g(x)|,$$

whenever  $x > k$ . [This is read as “ $f(x)$  is big-oh of  $g(x)$ .”]

# Big-O Estimates for Some Functions

# Big-Omega Notation

Let  $f$  and  $g$  be functions from the set of integers or the set of real numbers to the set of real numbers. We say that  $f(x)$  is  $\Omega(g(x))$  if there are positive constants  $C$  and  $k$  such that

$$|f(x)| \geq C|g(x)|$$

whenever  $x > k$ . [This is read as “ $f(x)$  is big-Omega of  $g(x)$ .”]

Let  $f$  and  $g$  be functions from the set of integers or the set of real numbers to the set of real numbers. We say that  $f(x)$  is  $\Theta(g(x))$  if

- $f(x)$  is  $O(g(x))$  and
- $f(x)$  is  $\Omega(g(x))$ .

When  $f(x)$  is  $\Theta(g(x))$ , we say that  $f(x)$  is big-Theta of  $g(x)$ , that  $f(x)$  is of order  $g(x)$ , and that  $f(x)$  and  $g(x)$  are of the same order.

We will NOT let you compute the complexity of an algorithm.

of Science and  
Technology

# Lecture Schedule

- |                                  |             |
|----------------------------------|-------------|
| 1 Logic and Mathematical Proofs  | 6 Recursion |
| 2 Sets and Functions             | 7 Counting  |
| 3 Complexity of Algorithms       | 8 Relations |
| 4 Number Theory and Cryptography | 9 Graph     |
| 5 Mathematical Induction         | 10 Trees    |

# Division

**Divisibility:** We say that  $a$  divides  $b$  if there is an integer  $c$  such that  $b = ac$ , or equivalently  $b/a$  is an integer.

- If  $a, b, c$  are integers, where  $a \neq 0$ , such that  $a|b$  and  $a|c$ , then  $a|(mb + nc)$  whenever  $m$  and  $n$  are integers.

**Congruence Relation:** If  $a$  and  $b$  are integers and  $m$  is a positive integer, then  $a$  is congruent to  $b$  modulo  $m$  if  $m$  divides  $a - b$ , denoted by  $a \equiv b \pmod{m}$ . Equivalently,

$$a \bmod m = b \bmod m$$

The integers  $a$  and  $b$  are congruent modulo  $m$  if and only if there is an integer  $k$  such that

$$a = b + km$$

# Congruence: Properties

**Theorem:** Let  $m$  be a positive integer. If  $a \equiv b \pmod{m}$  and  $c \equiv d \pmod{m}$ , then

$$a + c \equiv b + d \pmod{m}$$

$$ac \equiv bd \pmod{m}$$

**Corollary:** Let  $m$  be a positive integer and let  $a$  and  $b$  be integers. Then,

$$(a + b) \pmod{m} = ((a \pmod{m}) + (b \pmod{m})) \pmod{m}$$

$$ab \pmod{m} = ((a \pmod{m})(b \pmod{m})) \pmod{m}$$

How to compute  $b^n \pmod{m}$ ?

If  $ca \equiv cb \pmod{m}$ , then  $a \equiv b \pmod{m}$ ? Any condition?

**SUSTech**

Technology

# Primes

An integer  $p$  that is greater than 1 is called a **prime** if the **only** positive factors of  $p$  are 1 and  $p$ .

- If  $n$  is composite, then  $n$  has a prime divisor less than or equal to  $\sqrt{n}$ .

Let  $a$  and  $b$  be integers, not both 0. The **largest** integer  $d$  such that  $d|a$  and  $d|b$  is called the **greatest common divisor** of  $a$  and  $b$ , denoted by **gcd**( $a, b$ ). Let  $a = p_1^{a_1} p_2^{a_2} \dots p_n^{a_n}$  and  $b = p_1^{b_1} p_2^{b_2} \dots p_n^{b_n}$ . Then,

$$\text{gcd}(a, b) = p^{\min(a_1, b_1)} p^{\min(a_2, b_2)} \dots p^{\min(a_n, b_n)}$$

The **least common multiple** of  $a$  and  $b$  is the **smallest positive integer** that is divisible by both  $a$  and  $b$ , denoted by  $\text{lcm}(a, b)$ . Let  $a = p_1^{a_1} p_2^{a_2} \dots p_n^{a_n}$  and  $b = p_1^{b_1} p_2^{b_2} \dots p_n^{b_n}$ . Then,

$$\text{lcm}(a, b) = p^{\max(a_1, b_1)} p^{\max(a_2, b_2)} \dots p^{\max(a_n, b_n)}.$$

# Euclidean Algorithm

Computing the **greatest common divisor** of two integers directly from the prime factorizations can be **time consuming** since we need to find all factors of the two integers.

For two integers 287 and 91, we want to find  $\gcd(287, 91)$ .

$$\text{Step 1: } 287 = 91 \cdot 3 + 14$$

$$\text{Step 2: } 91 = 14 \cdot 6 + 7$$

$$\text{Step 3: } 14 = 7 \cdot 2 + 0$$

$$\gcd(287, 91) = \gcd(91, 14) = \gcd(14, 7) = 7$$

How to prove?

# GCD as Linear Combinations

**Bezout's Theorem:** If  $a$  and  $b$  are positive integers, then there exist integers  $s$  and  $t$  such that

$$\gcd(a, b) = sa + tb.$$

This equation is called Bezout's identity.

We can use **extended Euclidean algorithm** to find Bezout's identity.

**Lemma:** If  $a$ ,  $b$ ,  $c$  are positive integers such that  $\gcd(a, b) = 1$  and  $a|bc$ , then  $a|c$ .

**Lemma:** If  $p$  is prime and  $p|a_1a_2\dots a_n$ , then  $p|a_i$  for some  $i$ .

# Linear Congruences

A congruence of the form  $ax \equiv b \pmod{m}$ , where  $m$  is a positive integer,  $a$  and  $b$  are integers, and  $x$  is a variable, is called a **linear congruence**.

The solutions to a linear congruence  $ax \equiv b \pmod{m}$  are **all integers  $x$**  that satisfy the congruence.

**Modular Inverse:** An integer  $\bar{a}$  such that  $\bar{a}a \equiv 1 \pmod{m}$  is said to be an **inverse** of  $a$  modulo  $m$ .

Solve the congruence  $ax \equiv b \pmod{m}$  by **multiplying both sides by  $\bar{a}$** .

$$x \equiv \bar{a}b \pmod{m}.$$

# Modular Inverse

**Modular Inverse:** An integer  $\bar{a}$  such that  $\bar{a}a \equiv 1 \pmod{m}$  is said to be an **inverse** of  $a$  modulo  $m$ .

When does inverse exist?

**Theorem:** If  $a$  and  $m$  are **relatively prime integers** and  $m > 1$ , then an inverse of  $a$  modulo  $m$  **exists**. The inverse is **unique** modulo  $m$ . That is,

- there is a unique positive integer  $\bar{a}$  less than  $m$  that is an inverse of  $a$  modulo  $m$  and
- every other inverse of  $a$  modulo  $m$  is congruent to  $\bar{a}$  modulo  $m$ .

# Modular Inverse

## How to find inverses?

Using **extended Euclidean algorithm**:

**Example:** Find an inverse of 101 modulo 4620. That is, find  $\bar{a}$  such that  $\bar{a} \cdot 101 \equiv 1 \pmod{4620}$ .

With extended Euclidean algorithm, we obtain  $\gcd(a, b) = sa + tb$ , i.e.,  $1 = -35 \cdot 4620 + 1601 \cdot 101$ . It tells us that  $-35$  and  $1601$  are Bezout coefficients of 4620 and 101. We have

$$1 \pmod{4620} = 1601 \cdot 101 \pmod{4620}.$$

Thus, 1601 is an inverse of 101 modulo 4620.

# The Chinese Remainder Theorem

**Theorem** (The Chinese Remainder Theorem): Let  $m_1, m_2, \dots, m_n$  be **pairwise relative prime** positive integers greater than 1 and  $a_1, a_2, \dots, a_n$  arbitrary integers. Then, the system

$$x \equiv a_1 \pmod{m_1}$$

$$x \equiv a_2 \pmod{m_2}$$

...

$$x \equiv a_n \pmod{m_n}$$

has a **unique solution** modulo  $m = m_1 m_2 \dots m_n$ .

(That is, there is a solution  $x$  with  $0 \leq x < m$ , and all other solutions are congruent modulo  $m$  to this solution.)

# The Chinese Remainder Theorem: Example

$$x \equiv 2 \pmod{3}$$

$$x \equiv 3 \pmod{5}$$

$$x \equiv 2 \pmod{7}$$

- 1 Let  $m = 3 \cdot 5 \cdot 7 = 105$ ,  $M_1 = m/3 = 35$ ,  $M_2 = m/5 = 21$ , and  $M_3 = m/7 = 15$ .
- 2 Compute  $y_k$ , i.e., the inverse of  $M_k$  modulo  $m_k$ :
  - ▶  $35 \cdot 2 \equiv 1 \pmod{3}$   $y_1 = 2$
  - ▶  $21 \equiv 1 \pmod{5}$   $y_2 = 1$
  - ▶  $15 \equiv 1 \pmod{7}$   $y_3 = 1$
- 3 Compute a solution  $x = a_1 M_1 y_1 + \dots + a_n M_n y_n$ :  
 $x = 2 \cdot 35 \cdot 2 + 3 \cdot 21 \cdot 1 + 2 \cdot 15 \cdot 1 \equiv 233 \equiv 23 \pmod{105}$
- 4 The solutions are all integers  $x$  that satisfy  $x \equiv 23 \pmod{105}$ .

How to prove  $x \equiv 23 \pmod{105}$  is the solution?

## Back Substitution

We may also solve systems of linear congruences with pairwise relatively prime moduli  $m_1, m_2, \dots, m_n$  by back substitution.

**Example:**

$$(1) \ x \equiv 1 \pmod{5}$$

$$(2) \ x \equiv 2 \pmod{6}$$

$$(3) \ x \equiv 3 \pmod{7}$$

According to (1),  $x = 5t + 1$ , where  $t$  is an integer.

Substituting this expression into (2), we have  $5t + 1 \equiv 2 \pmod{6}$ , which means that  $t \equiv 5 \pmod{6}$ . Thus,  $t = 6u + 5$ , where  $u$  is an integer.

Substituting  $x = 5t + 1$  and  $t = 6u + 5$  into (3), we have  $30u + 26 \equiv 3 \pmod{7}$ , which implies that  $u \equiv 6 \pmod{7}$ . Thus,  $u = 7v + 6$ , where  $v$  is an integer.

Thus, we must have  $x = 210v + 206$ . Translating this back into a congruence,

$$x \equiv 206 \pmod{210}.$$

**SUSTech**

Southern University  
of Science and  
Technology

# The Chinese Remainder Theorem

What if  $m_1, m_2, \dots, m_n$  are positive integers greater than 1, but they are **not** pairwise relatively prime?

$$x \equiv a_1 \pmod{m_1}$$

$$x \equiv a_2 \pmod{m_2}$$

...

$$x \equiv a_n \pmod{m_n}$$

**Translate** these congruence into a set of congruence that together are equivalent to the given congruence:

For  $x \equiv a_k \pmod{m_k}$ , suppose  $m_k$  can be written as  $m_k = b_k^1 b_k^2 \cdot b_k^r$ , where  $b_k^1, b_k^2, \dots, b_k^r$  are all primes. Then,  $x \equiv a_k \pmod{m_k}$  is equivalent to the following set of congruence:

$$x \equiv a_k \pmod{b_k^1}$$

$$x \equiv a_k \pmod{b_k^2}$$

...

$$x \equiv a_k \pmod{b_k^r}$$

# RSA Cryptosystem

Pick two large primes  $p$  and  $q$ . Let  $n = pq$ . **Encryption key**  $(n, e)$  and **decryption key**  $(n, d)$  are selected such that

$$(1) \gcd(e, (p-1)(q-1)) = 1$$

$$(2) ed \equiv 1 \pmod{(p-1)(q-1)}$$

**RSA encryption:**  $C = M^e \bmod n$ ;

**RSA decryption:**  $M = C^d \bmod n$ .

How to prove RSA decryption can recover the message?

Digital Signature?

# The Principle of Mathematical Induction

**Well-Ordering Property:** Every nonempty set of nonnegative integers has a least element.

**Principle. (Weak Principle of Mathematical Induction)**

(a) **Basic Step:** the statement  $P(b)$  is true

(b) **Inductive Step:** the statement  $P(n - 1) \rightarrow P(n)$  is true for all  $n > b$

Thus,  $P(n)$  is true for all integers  $n \geq b$ .

**Principle (Strong Principle of Mathematical Induction):**

(a) **Basic Step:** the statement  $P(b)$  is true

(b) **Inductive Step:** for all  $n > b$ , the statement

$$P(b) \wedge P(b + 1) \wedge \dots \wedge P(n - 1) \rightarrow P(n) \text{ is true.}$$

Then,  $P(n)$  is true for all integers  $n \geq b$ .

# Counting

**Product Rule:** If a count of elements can be broken down into a **sequence of dependent counts** where the first count yields  $n_1$  elements, the second  $n_2$  elements, and  $k$ -th count  $n_k$  elements, then the total number of elements is

$$n = n_1 \times n_2 \times \dots \times n_k$$

## Sum Rule:

- A task can be done either in one of  $n_1$  ways or in one of  $n_2$  ways
- None of the set of  $n_1$  ways is the same as any of the set of  $n_2$  ways

## The Subtraction Rule:

- A task can be done in **either  $n_1$  ways or  $n_2$  ways**
- **Principle of inclusion–exclusion:**

$$|A_1 \cup A_2| = |A_1| + |A_2| - |A_1 \cap A_2|.$$

**SUSTech**

Southern University  
of Science and  
Technology

# Pigeonhole Principle

Assume that there are a set of objects and a set of bins to store them.

**The Pigeonhole Principle:** If  $k$  is a positive integer and  $k + 1$  or more objects are placed into  $k$  boxes, then there is at **least one box containing two or more** of the objects.

If  $N$  objects are placed into  $k$  bins, then there is at least one bin containing **at least  $\lceil N/k \rceil$  objects**.

**Use pigeonhole principle in proofs.**

# Permutations and Combinations

**Theorem:** If  $n$  is a positive integer and  $r$  is an integer with  $1 \leq r \leq n$ , then there are

$$P(n, r) = n(n-1)(n-2) \cdots (n-r+1)$$

$r$ -permutations of a set with  $n$  distinct elements.

**Theorem:** For integers  $n$  and  $r$  with  $0 \leq r \leq n$ , the number of  $r$ -element subsets of an  $n$ -element set is

$$\binom{n}{r} = C(n, r) = \frac{P(n, r)}{r!} = \frac{n!}{r!(n-r)!}$$

# Combinatorial Proof

**Theorem:** Let  $n$  and  $r$  be nonnegative integers with  $r \leq n$ . Then  $C(n, r) = C(n, n - r)$ .

**Definition:** A combinatorial proof of an identity is

- a proof that uses counting arguments to prove that both sides of the identity count the same objects but in different ways
- or a proof that is based on showing that there is a bijection between the sets of objects counted by the two sides of the identity.

These two types of proofs are called double counting proofs and bijective proofs, respectively.

**Use combinatorial proof to prove.**

# The Binomial Theorem

Let  $x$  and  $y$  be variables, and let  $n$  be a nonnegative integer:

$$(x + y)^n = \sum_{j=0}^n \binom{n}{j} x^{n-j} y^j = \binom{n}{0} x^n + \binom{n}{1} x^{n-1} y + \cdots + \binom{n}{n-1} x y^{n-1} + \binom{n}{n} y^n.$$

**Corollary:** Let  $n$  be a nonnegative integer,

$$\sum_{k=0}^n \binom{n}{k} = 2^n.$$

**Theorem:** Let  $n$  and  $k$  be positive integers with  $n \geq k$ . Then,

$$\binom{n+1}{k} = \binom{n}{k-1} + \binom{n}{k}.$$

# Generalized Permutations and Combinations

- Permutations with repetition

**Repetition:** Distinct objects; each can be selected multiple times

**Theorem:** The number of  $r$ -permutations of a set of  $n$  objects **with repetition** allowed is  $n^r$ .

- Permutations with indistinguishable objects

**Indistinguishable objects:** E.g., “SUCCESS”

**Theorem:** The number of different permutations of  $n$  objects, where there are  $n_1$  **indistinguishable objects** of type 1,  $n_2$  indistinguishable objects of type 2, . . . , and  $n_k$  indistinguishable objects of type  $k$ , is

$$C(n, n_1)(n - n_1, n_2) \cdots C(n - n_1 - \cdots n_{k-1}, n_k) = \frac{n!}{n_1!n_2! \cdots n_k!}.$$

- Combinations with repetition

**SUSTech**  
Southern University  
of Science and  
Technology

# Combinations with Repetition

**Example:** How many ways are there to select five bills from a cash box containing \$1 bills, \$2 bills, \$5 bills, \$10 bills, \$20 bills, \$50 bills, and \$100 bills?

**Theorem:** There are  $C(n + r - 1, r) = C(n + r - 1, n - 1)$   $r$ -combinations from a set with  $n$  elements when repetition of elements is allowed.

# Solving Linear Homogeneous Recurrence Relations

**Definition:** A **linear homogeneous relation** of degree  $k$  with constant coefficients is a recurrence relation of the form

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k},$$

where  $c_1, c_2, \dots, c_k$  are real numbers, and  $c_k \neq 0$ .

By induction, such a recurrence relation is **uniquely** determined by this recurrence relation and  **$k$  initial conditions**  $a_0, a_1, \dots, a_{k-1}$ .

# Solving Linear Homogeneous Recurrence Relations

The characteristic equation (CE) is:

$$r^k - \sum_{i=1}^k c_i r^{k-i} = 0.$$

**Theorem:** Suppose that there are  $t$  roots  $r_1, \dots, r_t$  with multiplicities  $m_1, \dots, m_t$ . Then,

$$\begin{aligned} a_n = & (\alpha_{1,0} + \alpha_{1,1}n + \dots + \alpha_{1,m_1-1}n^{m_1-1})r_1^n \\ & + (\alpha_{2,0} + \alpha_{2,1}n + \dots + \alpha_{2,m_2-1}n^{m_2-1})r_2^n \\ & + \dots + (\alpha_{t,0} + \alpha_{t,1}n + \dots + \alpha_{t,m_t-1}n^{m_t-1})r_t^n \end{aligned}$$

- Solving the roots with CE
- Solving the  $\alpha_i$  for all  $i$  using initial conditions

# Linear Nonhomogeneous Recurrence Relations

**Definition:** A linear nonhomogeneous relation with constant coefficients may contain some terms  $F(n)$  that depend only on  $n$

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k} + F(n).$$

The recurrence relation  $a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k}$  is called the associated homogeneous recurrence relation.

**Theorem:** If  $\{a_n^{(p)}\}$  is any particular solution to the linear nonhomogeneous relation with constant coefficients,

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k} + F(n),$$

Then all its solutions are of the form

$$a_n = a_n^{(p)} + a_n^{(h)},$$

where  $\{a_n^{(h)}\}$  is any solution to the associated homogeneous recurrence relation  $a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k}$ .

# Linear Nonhomogeneous Recurrence Relations

Suppose that  $\{a_n\}$  satisfies the linear nonhomogeneous recurrence relation

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \cdots + c_k a_{n-k} + F(n),$$

where  $c_1, c_2, \dots, c_k$  are real numbers, and

$$F(n) = (b_t n^t + b_{t-1} n^{t-1} + \cdots + b_1 n + b_0) s^n,$$

where  $b_0, b_1, \dots, b_t$  and  $s$  are real numbers. When  $s$  is not a root of the characteristic equation of the associated linear homogeneous recurrence relation, there is a particular solution of the form

$$(p_t n^t + p_{t-1} n^{t-1} + \cdots + p_1 n + p_0) s^n.$$

When  $s$  is a root of this characteristic equation and its multiplicity is  $m$ , there is a particular solution of the form

$$n^m (p_t n^t + p_{t-1} n^{t-1} + \cdots + p_1 n + p_0) s^n.$$

Pay attention to the case when  $s = 1$ .

# Generating function

The **generating function** for the sequence  $a_0, a_1, \dots, a_k, \dots$  of **real numbers** is the infinite series

$$G(x) = a_0 + a_1x + \dots + a_kx^k + \dots = \sum_{k=0}^{\infty} a_kx^k.$$

## How to use generating function to solve counting problems?

- Based on the combination problem, transfer the problem as finding the coefficient of  $x^r$  of a generating function, e.g.,

$$G(x) = (1 + x + x^2 + x^3 + \dots)^n$$

- Find the coefficient of  $x^r$ 
  - ▶ Enumerate all possibilities or
  - ▶ **Sum of geometric progression, binomial theorem**

## How to use generating function to solve linear recurrence relation?

# Cartesian Product

Let  $A = \{a_1, a_2, \dots, a_m\}$  and  $B = \{b_1, b_2, \dots, b_n\}$ , the **Cartesian product**  $A \times B$  is the set of pairs  $\{(a_1, b_1), (a_2, b_2), \dots, (a_1, b_n), \dots, (a_m, b_n)\}$ .

Let  $A$  and  $B$  be two sets. A **binary relation** from  $A$  to  $B$  is a subset of a Cartesian product  $A \times B$ .

A **relation on the set  $A$**  is a relation from  $A$  to **itself**.

We use the notation  $aRb$  to denote  $(a, b) \in R$ , and  $a \not R b$  to denote  $(a, b) \notin R$ .

| $R$ | 1 | 2 | 3 | 4 |
|-----|---|---|---|---|
| 1   | × | × | × | × |
| 2   |   | × |   | × |
| 3   |   |   | × |   |
| 4   |   |   |   | × |

# Summary on Properties of Relations

- **Reflexive Relation:** A relation  $R$  on a set  $A$  is called reflexive if  $(a, a) \in R$  for every element  $a \in A$ .
- **Irreflexive Relation:** A relation  $R$  on a set  $A$  is called irreflexive if  $(a, a) \notin R$  for every element  $a \in A$ .
- **Symmetric Relation:** A relation  $R$  on a set  $A$  is called symmetric if  $(b, a) \in R$  whenever  $(a, b) \in R$  for all  $a, b \in A$ .
- **Antisymmetric Relation:** A relation  $R$  on a set  $A$  is called antisymmetric if  $(b, a) \in R$  and  $(a, b) \in R$  implies  $a = b$  for all  $a, b \in A$ .
- **Transitive Relation:** A relation  $R$  on a set  $A$  is called transitive if  $(a, b) \in R$  and  $(b, c) \in R$  implies  $(a, c) \in R$  for all  $a, b, c \in A$ .

The number of relations?

# Composite of Relations

**Definition:** Let  $R$  be a relation from a set  $A$  to a set  $B$  and  $S$  be a relation from  $B$  to  $C$ . The composite of  $R$  and  $S$  is the relation consisting of the ordered pairs  $(a, c)$  where  $a \in A$  and  $c \in C$  and for which there is a  $b \in B$  such that  $(a, b) \in R$  and  $(b, c) \in S$ .

**Example:** Let  $A = \{1, 2, 3\}$ ,  $B = \{0, 1, 2\}$ , and  $C = \{a, b\}$ :

- $R = \{(1, 0), (1, 2), (3, 1), (3, 2)\}$
- $S = \{(0, b), (1, a), (2, b)\}$
- $S \circ R = \{(1, b), (3, a), (3, b)\}$

# Power of a Relation

**Definition:** Let  $R$  be a relation on  $A$ . The **powers**  $R^n$ , for  $n = 1, 2, 3, \dots$ , is defined inductively by

$$R^1 = R \text{ and } R^{n+1} = R^n \circ R$$

**Theorem:** The relation  $R$  on a set  $A$  is transitive if and only if  $R^n \subseteq R$  for  $n = 1, 2, 3, \dots$

How to prove?

Physical meaning of  $R^n$  in the associated directed graph?

# Representing Relations

Some special ways to represent **binary relations**:

- with a zero-one matrix
- with a directed graph

$$\begin{bmatrix} 1 & & & & \\ & 1 & & & \\ & & 1 & & \\ & & & \ddots & \\ & & & & 1 & \\ & & & & & 1 \end{bmatrix}$$

Reflexive

$$\begin{bmatrix} & 1 & \\ 1 & & \\ & & 0 \end{bmatrix}$$

Symmetric

$$\begin{bmatrix} & 1 & 0 \\ 0 & & \\ 0 & 1 & \end{bmatrix}$$

Antisymmetric

# Zero-One Matrix

Consider relations  $R_1$  and  $R_2$  on a set  $A$ :

$$M_{R_1 \cup R_2} = M_{R_1} \vee M_{R_2}$$

$$M_{R_1 \cap R_2} = M_{R_1} \wedge M_{R_2}$$

Suppose that  $R$  is a relation from  $A$  to  $B$  and  $S$  is a relation from  $B$  to  $C$ :

$$M_{S \circ R} = M_R \odot M_S.$$

The ordered pair  $(a_i, c_j)$  belongs to  $S \circ R$  **if and only if** there is an element  $b_k$  such that  $(a_i, b_k)$  belongs to  $R$  and  $(b_k, c_j)$  belongs to  $S$ .

# Directed Graph

A **directed graph**, or digraph, consists of a set  $V$  of **vertices** together with a set  $E$  of ordered pairs of elements of  $V$  called **edges**.

The vertex  $a$  is called the **initial vertex** of the edge  $(a, b)$ , and the vertex  $b$  is called the **terminal vertex** of this edge.

reflexive

irreflexive

symmetric

antisymmetric

# Closures of Relations

The set  $S$  is called the **reflexive closure** of  $R$  if it:

- contains  $R$
- is reflexive
- is minimal (is contained in **every** reflexive relation  $Q$  that contains  $R$  ( $R \subseteq Q$ ), i.e.,  $S \subseteq Q$ )

## Proof?

Relations can have different **properties**:

- Reflexive closures
- Symmetric closures
- Transitive closures: Finding a **transitive closure** corresponds to finding all pairs of elements that are connected with a directed path.

# Paths in Directed Graphs

**Definition:** A path from  $a$  to  $b$  in the directed graph  $G$  is a sequence of edges  $(x_0, x_1), (x_1, x_2), \dots, (x_{n-1}, x_n)$  in  $G$ , where  $n$  is nonnegative and  $x_0 = a$  and  $x_n = b$ .

A path of length  $n \geq 1$  that begins and ends at the same vertex is called a circuit or cycle.

**Theorem:** Let  $R$  be relation on a set  $A$ . There is a path of length  $n$  from  $a$  to  $b$  if and only if  $(a, b) \in R^n$ .

**Proof** (by induction)

# Connectivity Relation

**Definition:** Let  $R$  be a relation on a set  $A$ . The **connectivity relation**  $R^*$  consists of **all pairs**  $(a, b)$  such that there is a path (of any length) between  $a$  and  $b$  in  $R$ :

$$R^* = \bigcup_{k=1}^{\infty} R^k$$

**Theorem:** The transitive closure of a relation  $R$  equals the connectivity relation  $R^*$ .

**Prove**  $R^*$  **is a transitive closure of**  $R$ ?

# Find Transitive Closure

**Lemma:** If there is a path of length at least one in  $R$  from  $a$  to  $b$ , then there is such a path with length **not exceeding**  $n$ .

Thus,

$$R^* = R \cup R^2 \cup R^3 \cup \dots \cup R^n.$$

**Theorem:** Let  $M_R$  be the zero-one matrix of the relation  $R$  on a set with  $n$  elements. Then the zero-one matrix of the transitive closure  $R^*$  is

$$M_{R^*} = M_R \vee M_R^{[2]} \vee M_R^{[3]} \vee \dots \vee M_R^{[n]},$$

where  $M_R^{[n]} = \underbrace{M_R \odot M_R \odot \dots \odot M_R}_{n \text{ } M'_R \text{'s}}$

Technology

# Roy-Warshall Algorithm

Consider a list of vertices  $v_1, v_2, \dots, v_k, \dots, v_n$ . Define a zero-one matrix

$$\mathbf{W}_k = [w_{ij}^{(k)}],$$

where  $w_{ij}^{(k)} = 1$  if there is a path from  $v_i$  to  $v_j$  such that **all the interior vertices** of this path are in the set  $\{v_1, v_2, \dots, v_k\}$  and is 0 otherwise.

Warshall's algorithm computes  $M_{R^*}$  by efficiently computing

$$\mathbf{W}_0 = M_R, W_1, W_2, \dots, \mathbf{W}_n = M_{R^*}.$$

## ALGORITHM 2 Warshall Algorithm.

**procedure** *Warshall* ( $\mathbf{M}_R : n \times n$  zero-one matrix)

$\mathbf{W} := \mathbf{M}_R$

**for**  $k := 1$  **to**  $n$

**for**  $i := 1$  **to**  $n$

**for**  $j := 1$  **to**  $n$

$w_{ij} := w_{ij} \vee (w_{ik} \wedge w_{kj})$

**return**  $\mathbf{W}$  { $\mathbf{W} = [w_{ij}]$  is  $\mathbf{M}_{R^*}$ }

# Equivalence Relation

**Definition:** A relation  $R$  on a set  $A$  is called an **equivalence relation** if it is reflexive, symmetric, and transitive.

**Definition:** Let  $R$  be an **equivalence relation on a set  $A$** . The set of all elements that are related to an **element  $a$**  of  $A$  is called **the equivalence class of  $a$** , denoted by  $[a]_R$ . When only one relation is considered, we use the notation  $[a]$ .

$$[a]_R = \{b : (a, b) \in R\}$$

**Theorem:** Let  $R$  be an **equivalence relation** on a set  $A$ . The following statements are equivalent:

$$(i) aRb \quad (ii) [a] = [b] \quad (iii) [a] \cap [b] \neq \emptyset$$

# Partition of a Set $S$

**Definition:** Let  $S$  be a set. A collection of nonempty subsets of  $S$ , i.e.  $A_1, A_2, \dots, A_k$ , is called a partition of  $S$  if:

$$A_i \cap A_j = \emptyset, i \neq j \text{ and } S = \bigcup_{i=1}^k A_i$$

**Theorem:** The equivalence classes form a partition of  $A$ .

**Theorem:** Let  $\{A_1, A_2, \dots, A_i, \dots\}$  be a partition of  $S$ . Then, there is an equivalence relation  $R$  on  $S$ , that has the sets  $A_i$  as its equivalence classes.

# Partial Ordering

**Definition:** A relation  $R$  on a set  $S$  is called a **partial ordering**, or partial order, if it is **reflexive**, **antisymmetric**, and **transitive**.

A set  $S$  together with a partial ordering  $R$  is called a **partially ordered set**, or **poset**, denoted by  $(S, R)$ .

The notation  $a \preceq b$  is used to denote that  $(a, b) \in R$  in an arbitrary poset  $(S, R)$ .

The notation  $a \prec b$  denotes that  $a \preceq b$ , but  $a \neq b$ .

# Comparability

**Definition:** The elements  $a$  and  $b$  of a poset  $(S, \preceq)$  are comparable if either  $a \preceq b$  or  $b \preceq a$ . Otherwise,  $a$  and  $b$  are called incomparable.

**Definition:** If  $(S, \preceq)$  is a poset and every two elements of  $S$  are comparable,  $S$  is called a totally ordered or linearly ordered set, and  $\preceq$  is called a total order or a linear order.

$(S, \preceq)$  is a well-ordered set if it is a poset such that  $\preceq$  is a total ordering and every nonempty subset of  $S$  has a least element.

## The Principle of Well-Ordered Induction

# Hasse Diagram

Start with the directed graph of the relation:

- Remove the loops  $(a, a)$  present at every vertex due to the reflexive property.
- Remove all edges  $(x, y)$  for which there is an element  $z \in S$  s.t.  $x \prec z$  and  $z \prec y$ . These are the edges that must be present due to the transitive property.
- Arrange each edge so that its initial vertex is below the terminal vertex. Remove all the arrows, because all edges point upwards toward their terminal vertex.

# Maximal and Minimal Elements

**Definition:**  $a$  is a **maximal** (resp. **minimal**) element in poset  $(S, \preceq)$  if there is no  $b \in S$  such that  $a \prec b$  (resp.  $b \prec a$ ).

**Definition:**  $a$  is the **greatest** (resp. **least**) element of the poset  $(S, \preceq)$  if  $b \preceq a$  (resp.  $a \preceq b$ ) **for all**  $b \in S$ .

**Definition:** Let  $A$  be a subset of a poset  $(S, \preceq)$ .

- $u \in S$  is called an **upper bound** (resp. lower bound) of  $A$  if  $a \preceq u$  (resp.  $u \preceq a$ ) **for all**  $a \in A$ .
- $x \in S$  is called the **least upper bound** (resp. greatest lower bound) of  $A$  if  $x$  is an upper bound (resp. lower bound) that is **less than any other** upper bounds (resp. lower bounds) of  $A$ .

# Topological Sorting for Finite Posets

**Topological sorting:** Given a partial ordering  $R$ , find a total ordering  $\preceq$  such that  $a \preceq b$  whenever  $aRb$ .  $\preceq$  is said compatible with  $R$ .

Find a compatible total ordering for the poset  $(\{1, 2, 4, 5, 12, 20\}, |)$ .

This produces the total ordering

$$1 \prec 5 \prec 2 \prec 4 \prec 20 \prec 12$$

# Definition of a Graph

A **graph**  $G = (V, E)$  consists of a nonempty set  $V$  of vertices (or nodes) and a set  $E$  of edges. Each edge has either one or two vertices associated with it, called its endpoints. An edge is said to be incident to (or connect) its endpoints.

**Simple graph**: A graph in which each edge connects two **different** vertices and where **no** two edges connect the same pair of vertices.

Two vertices  $u, v$  in an **undirected graph**  $G$  are called **adjacent** (or neighbors) in  $G$  if there is an edge  $e$  between  $u$  and  $v$ . Such an edge  $e$  is called **incident** with the vertices  $u$  and  $v$  and  $e$  is said to connect  $u$  and  $v$ .

# Undirected Graphs

**Definition:** The set of all neighbors of a vertex  $v$  of  $G = (V, E)$ , denoted by  $N(v)$ , is called the **neighborhood of  $v$** .

If  $A$  is a **subset** of  $V$ , we denote by  $N(A)$  the set of all vertices in  $G$  that are adjacent to **at least one** vertex in  $A$ .

**Definition:** The degree of a vertex in an undirected graph is the **number of edges incident with it**, except that a **loop** at a vertex contributes **two** to the degree of that vertex. The degree of the vertex  $v$  is denoted by  $\deg(v)$ .

**Theorem** (Handshaking Theorem): If  $G = (V, E)$  is an **undirected** graph with  $m$  edges, then

$$2m = \sum_{v \in V} \deg(v)$$

# Directed Graphs

**Definition:** Let  $(u, v)$  be an edge in  $G$ . Then  $u$  is the **initial vertex** of the edge and is **adjacent to  $v$**  and  $v$  is the **terminal vertex** of this edge and is **adjacent from  $u$** . The initial and terminal vertices of a loop are the same.

**Definition:** The **in-degree** of a vertex  $v$ , denoted by  $\deg^-(v)$ , is the number of edges which terminate at  $v$ . The **out-degree** of  $v$ , denoted by  $\deg^+(v)$ , is the number of edges with  $v$  as their initial vertex.

Note that a loop at a vertex contributes 1 to both the in-degree and the out-degree of the vertex.

**Theorem:** Let  $G = (V, E)$  be a graph with directed edges. Then,

$$|E| = \sum_{v \in V} \deg^-(v) = \sum_{v \in V} \deg^+(v)$$

# Special Graphs

A **complete graph** on  $n$  vertices, denoted by  $K_n$ , is the simple graph that contains exactly one edge between each pair of distinct vertices.

A **cycle**  $C_n$  for  $n \geq 3$  consists of  $n$  vertices  $v_1, v_2, \dots, v_n$ , and edges  $\{v_1, v_2\}, \{v_2, v_3\}, \dots, \{v_{n-1}, v_n\}, \{v_n, v_1\}$ .

An  **$n$ -dimensional hypercube**, or  $n$ -cube,  $Q_n$  is a graph with  $2^n$  vertices representing all bit strings of length  $n$ , where there is an edge between two vertices that **differ in exactly one bit position**.

**SUSTech**

Southern University  
of Science and  
Technology

# Bipartite Graphs

**Definition:** A simple graph  $G$  is **bipartite** if  $V$  can be partitioned into two disjoint subsets  $V_1$  and  $V_2$  such that **every edge** connects a vertex in  $V_1$  and a vertex in  $V_2$ .

**Definition:** A **complete bipartite graph**  $K_{m,n}$  is a graph that has its vertex set partitioned into two subsets  $V_1$  of size  $m$  and  $V_2$  of size  $n$  such that there is an edge from **every** vertex in  $V_1$  to **every** vertex in  $V_2$ .

# Bipartite Graphs and Matchings

**Matching** the elements of one set to elements in another. A matching is a **subset of edges** such that no two edges are incident with the same vertex.

A matching  $M$  in a bipartite graph  $G = (V, E)$  with bipartition  $(V_1, V_2)$  is a **complete matching** from  $V_1$  to  $V_2$  if every vertex in  $V_1$  is the endpoint of an edge in the matching, or equivalently, if  $|M| = |V_1|$ .

**Theorem** (Hall's Marriage Theorem): The bipartite graph  $G = (V, E)$  with bipartition  $(V_1, V_2)$  has a complete matching from  $V_1$  to  $V_2$  if and only if  $|N(A)| \geq |A|$  for all subsets  $A$  of  $V_1$ .

**Proof?**

# Subgraphs

**Definition:** A **subgraph of a graph**  $G = (V, E)$  is a graph  $(W, F)$ , where  $W \subseteq V$  and  $F \subseteq E$ .

**Definition:** The **union of two simple graphs**  $G_1 = (V_1, E_1)$  and  $G_2 = (V_2, E_2)$  is the simple graph with vertex set  $V_1 \cup V_2$  and edge set  $E_1 \cup E_2$ , denoted by  $G_1 \cup G_2$ .

To represent a graph, we may use **adjacency lists**, **adjacency matrices**, and **incidence matrices**.

# Isomorphism of Graphs

**Definition:** The simple graphs  $G_1 = (V_1, E_1)$  and  $G_2 = (V_2, E_2)$  are **isomorphic** if there is a **one-to-one and onto function** from  $V_1$  to  $V_2$  with the property that  $a$  and  $b$  are adjacent in  $G_1$  if and only if  $f(a)$  and  $f(b)$  are adjacent in  $G_2$ , for all  $a$  and  $b$  in  $V_1$ . Such a function is called an **isomorphism**.

Useful graph invariants include the **number of vertices**, **number of edges**, **degree sequence**, existence circuit with certain length, etc.

*G*

*H*

# Path: Undirected Graph

**Definition:** Let  $n$  be a nonnegative integer and  $G$  an **undirected** graph. A **path of length  $n$  from  $u$  to  $v$**  in  $G$  is a sequence of  $n$  edges  $e_1, e_2, \dots, e_n$  of  $G$  for which there exists a sequence  $x_0 = u, x_1, \dots, x_{n-1}, x_n = v$  of vertices such that  $e_i$  has the endpoints  $x_{i-1}$  and  $x_i$  for  $i = 1, \dots, n$ .

The path is a **circuit** if it begins and ends at the same vertex, i.e., if  $u = v$ , and has length greater than zero.

A path or circuit is **simple** if it does not contain **the same edge** more than once.

Length of a path = the number of edges on path

# Connectivity

An undirected graph is called **connected** if there is a path between **every pair** of distinct vertices of the graph.

**Lemma:** If there is a path between two distinct vertices  $x$  and  $y$  of a graph  $G$ , then there is a simple path between  $x$  and  $y$  in  $G$ .

**Theorem:** There is a **simple path** between every pair of distinct vertices of a **connected** undirected graph.

# Connectivity

A **connected component** of a graph  $G$  is a **connected** subgraph of  $G$  that is **not a proper** subgraph of another connected subgraph of  $G$ .

A graph  $G$  that is not connected has two or more connected components that are disjoint and have  $G$  as their union.

**Definition:** A directed graph is **strongly connected** if there is a path from  $a$  to  $b$  **and** a path from  $b$  to  $a$  whenever  $a$  and  $b$  are vertices in the graph.

**Definition:** A directed graph is **weakly connected** if there is a path between every two vertices in the **underlying undirected graph**.

# Cut Vertices and Cut Edges

Sometimes the **removal** from a graph of a vertex and all incident edges disconnect the graph. Such vertices are called **cut vertices**.

Similarly, we define **cut edges**.

A set of edges  $E'$  is called an edge cut of  $G$  if the subgraph  $G - E'$  is disconnected. The **edge connectivity**  $\lambda(G)$  is the **minimum** number of edges in an edge cut of  $G$ .

# Counting Paths between Vertices

**Theorem:** Let  $G$  be a graph with adjacency matrix  $\mathbf{A}$  with respect to the ordering  $v_1, v_2, \dots, v_n$  of vertices. The number of different paths of length  $r$  from  $v_i$  to  $v_j$ , where  $r$  is a positive integer, equals the  $(i, j)$ -th entry of  $\mathbf{A}^r$ .

**Proof (by induction)**

Note: with directed or undirected edges, multiple edges and loops allowed

# Euler Paths

**Definition:** An **Euler circuit** in a graph  $G$  is a **simple circuit** containing every edge of  $G$ . An Euler path in  $G$  is a simple path containing every edge of  $G$ .

**Theorem:** A connected multigraph with at least two vertices has an **Euler circuit** if and only if each of its vertices has **even degree**.

**Theorem:** A connected multigraph has an Euler path but not an **Euler circuit** if and only if it has exactly **two vertices of odd degree**.

# Hamilton Paths and Circuits

**Definition:** A simple path in a graph  $G$  that passes through every vertex exactly once is called a **Hamilton path**, and a simple circuit in a graph  $G$  that passes through every vertex exactly once is called a **Hamilton circuit**.

**Example:** Which of these simple graphs has a Hamilton circuit or, if not, a Hamilton path?

- $G_1$  has a Hamilton circuit:  $a, b, c, d, e, a$ ;
- $G_2$  has no Hamilton circuit (because containing every vertex must contain the edge  $a, b$  twice), but it has a Hamilton path;
- $G_3$  has neither, because any path containing all vertices must contain one of the edges  $\{a, b\}$ ,  $\{e, f\}$ , and  $\{c, d\}$  more than once.

# Planar Graphs

**Definition:** A graph is called **planar** if it can be drawn in the **plane without any edges crossing**. Such a drawing is called a **planar representation** of the graph.

A planar representation of a graph splits the plane into **regions**, including an unbounded region.

**Theorem (Euler's Formula):** Let  $G$  be a **connected planar simple graph** with  $e$  edges and  $v$  vertices. Let  $r$  be the number of regions in a planar representation of  $G$ . Then,  $r = e - v + 2$ .

**Proof?**

# Kuratowski's Theorem

If a graph is planar, **so will be any graph** obtained by removing an edge  $\{u, v\}$  and adding a new vertex  $w$  together with edges  $\{u, w\}$  and  $\{w, v\}$ . Such an operation is called an **elementary subdivision**.

The graphs  $G_1 = (V_1, E_1)$  and  $G_2 = (V_2, E_2)$  are called **homeomorphic** if they can be obtained from the same graph by a sequence of elementary subdivisions.

**Theorem:** A graph is **nonplanar** if and only if it contains a **subgraph homomorphic** to  $K_{3,3}$  or  $K_5$ .

**Example:**

# Trees

**Definition:** A **tree** is a connected undirected graph with **no simple circuits**.

**Theorem:** An undirected graph is a tree **if and only if** there is a **unique simple path** between any two of its vertices.

**Definition:** A **rooted tree** is a tree in which one vertex has been designated as the root and every edge is directed away from the root.

# $m$ -Ary Trees

**Definition:** A rooted tree is called an  $m$ -ary tree if every internal vertex has no more than  $m$  children.

The tree is called a full  $m$ -ary tree if every internal vertex has exactly  $m$  children.

In particular, an  $m$ -ary tree with  $m = 2$  is called a binary tree.

**Definition:** An ordered rooted tree is a rooted tree where the children of each internal vertex are ordered. Ordered rooted trees are drawn so that the children of each internal vertex are shown in order from left to right.

# Counting Vertices in a Full $m$ -Ary Trees

**Theorem:** A tree with  $n$  vertices has  $n - 1$  edges.

**Theorem:** A full  $m$ -ary tree with  $i$  internal vertices has  $n = mi + 1$  vertices.

# Level and Height

The **level** of a vertex  $v$  in a rooted tree is the length of the unique path from the root to this vertex.

The **height** of a rooted tree is the maximum of the levels of the vertices.

A rooted  $m$ -ary tree of height  $h$  is **balanced** if all leaves are at levels  $h$  or  $h - 1$ .

# Tree Traversal

The procedures for systematically **visiting every vertex** of an ordered tree are called **traversals**.

**Definition** Let  $T$  be an ordered rooted tree with root  $r$ . If  $T$  consists only of  $r$ , then  $r$  is the **preorder traversal** of  $T$ .

**Definition:** Let  $T$  be an **ordered rooted tree** with root  $r$ . If  $T$  consists only of  $r$ , then  $r$  is the inorder traversal of  $T$ .

**Definition:** Let  $T$  be an ordered rooted tree with root  $r$ . If  $T$  consists only of  $r$ , then  $r$  is the postorder traversal of  $T$ .

# Expression Trees

Complex expressions can be represented using ordered rooted trees.

- the internal vertices represent operations
- the leaves represent the variables or numbers

# Prefix Notation

Prefix expressions are evaluated by working **from right to left**. When we encounter an operator, we perform the operation with the **two operands to the right**.

**Example:**  $+ \ - \ * \ 2 \ 3 \ 5 \ / \ \uparrow \ 2 \ 3 \ 4$

$$\begin{array}{ccccccccccc} + & - & * & 2 & 3 & 5 & / & \uparrow & 2 & 3 & 4 \\ & & & & & & & \underbrace{\phantom{2 \uparrow 3 = 8}} & & & \\ & & & & & & & 2 \uparrow 3 = 8 & & & \\ & & & & & & & \underbrace{\phantom{8 / 4 = 2}} & & & \\ & & & & & & & 8 / 4 = 2 & & & \\ & & & & & & & & & & \\ + & - & * & 2 & 3 & 5 & 2 & & & & \\ & & \underbrace{\phantom{2 * 3 = 6}} & & & & & & & & \\ & & 2 * 3 = 6 & & & & & & & & \\ + & - & 6 & 5 & 2 & & & & & & \\ & \underbrace{\phantom{6 - 5 = 1}} & & & & & & & & & \\ & 6 - 5 = 1 & & & & & & & & & \\ + & 1 & 2 & & & & & & & & \\ \underbrace{\phantom{1 + 2 = 3}} & & & & & & & & & & \\ 1 + 2 = 3 & & & & & & & & & & \end{array}$$

The **postorder traversal** of expression trees leads to the **postfix form** of the expression (reverse Polish notation).

# Spanning Trees

**Definition:** Let  $G$  be a simple graph. A **spanning tree** of  $G$  is a **subgraph** of  $G$  that is a tree containing **every** vertex of  $G$ .

Remove edges to **avoid circuits**.

# Depth-First Search

- First, arbitrarily choose a vertex of the graph as the root.
- Form a path by successively **adding vertices** and edges. Continue adding to this path as long as possible.
- If the path goes through **all vertices** of the graph, the tree is a spanning tree.
- Otherwise, move back to some vertex to repeat this procedure (backtracking).

# Depth-First Search: Example

# Breadth-First Search

This is the second algorithm that we build up spanning trees by successively adding edges.

- First arbitrarily choose a vertex of the graph as the root.
- Form a path by adding **all edges** incident to this vertex and the other endpoint of each of these edges
- For each vertex added at the previous level, add edge incident to this vertex, as long as it does not produce a simple circuit.
- Continue in this manner until all vertices have been added.

# Breadth-First Search: Example
