Let  $A, B$  two groups, then we can get a bigger group by Direct Product, i.e.  $A \times B$ .

**Example 1.**  $G = (\mathbb{Z}_{15}, +)$ ,  $|G| = 15$ ,  $G = \langle 1 \rangle$ , cyclic group.  $A \leq G$  s.t.  $A = \langle 3 \rangle$ , and  $B \leq G$  s.t.  $B = \langle 5 \rangle$ . Claim:  $G = A \times B$ ?

**Theorem 2.** Let  $H, K \triangleleft G$  s.t.  $G = HK$ , then the following statements are equivalent:

- (1).  $\phi : H \times K \rightarrow G$  s.t.  $(h, k) \mapsto hk$  is an isomorphism.
- (2).  $H \cap K = \{e\}$ , where  $e$  is the identity.

证明. (1)  $\rightarrow$  (2): Assume  $\phi$  is an isomorphism. Suppose  $x \in H \cap K$  s.t.  $x \neq e$ . Then  $\phi : (x, e) \rightarrow xe = e$  and  $(e, x) \rightarrow ex = x$ , which is impossible since  $\phi$  is a bijection. Thus  $H \cap K = \{e\}$ .

(2)  $\rightarrow$  (1): Assume  $H \cap K = \{e\}$ . Define  $\phi : H \times K \rightarrow G$  s.t.  $(h, k) \mapsto hk$ . We need to show that  $\phi$  is a homomorphism, injective and surjective. Claim:  $hk = kh$  for all  $h \in H$  and  $k \in K$ . Consider  $[h, k] = hkh^{-1}k^{-1} = k_1k^{-1} \in K$ , and  $[k, h] = khk^{-1}h^{-1} = h_1h^{-1} \in H$ . Since  $H \cap K = \{e\}$ , we have  $k_1k^{-1} = h_1h^{-1} = e$ . Thus  $hk = kh$ .

Homomorphism:  $\phi((h_1, k_1)(h_2, k_2)) = \phi(h_1h_2, k_1k_2) = h_1h_2k_1k_2 = h_1k_1h_2k_2 = \phi(h_1, k_1)\phi(h_2, k_2)$ .

Injective: Suppose  $\phi(h_1, k_1) = \phi(h_2, k_2)$ . Then  $h_1k_1 = h_2k_2$ . Since  $H \cap K = \{e\}$ ,  $h_2^{-1}h_1 = k_2k_1^{-1} \in H \cap K$ , we have  $h_1 = h_2$  and  $k_1 = k_2$ . Thus  $\phi$  is injective.

Surjective: For any  $g \in G$ , since  $G = HK$ , there exist  $h \in H$  and  $k \in K$  s.t.  $g = hk$ . Thus  $\phi(h, k) = hk = g$ . Thus  $\phi$  is surjective.  $\square$

In a word,  $H \times K \simeq HK$ ,  $HK$  is called a inner product of  $H$  and  $K$ . i.e.  $G = H \times K = HK$ .

**Example 3.**  $G = H \times H$  where  $H = \mathbb{Z}_3$ ,  $G \neq HH$  since  $HH = H$ .

**Example 4.** Let  $G = \left\{ \begin{bmatrix} a & 0 & 0 \\ 0 & b_1 & b_2 \\ 0 & b_3 & b_4 \end{bmatrix} \mid a \in \mathbb{F}_p - \{0\}, b_1b_4 \neq b_2b_3 \right\}$ . Then  $G$  is a group with matrix multiplication where  $G < \text{GL}_3(\mathbb{F}_p)$ . Claim:  $G \simeq \mathbb{Z}_{p-1} \times \text{GL}_2\mathbb{F}_p$ .

Let  $A = \left\{ \begin{bmatrix} a & 0 \\ 0 & I_2 \end{bmatrix} \mid a \in \mathbb{F}_p - \{0\} \right\}$  and  $B = \left\{ \begin{bmatrix} 1 & 0 & 0 \\ 0 & b_1 & b_2 \\ 0 & b_3 & b_4 \end{bmatrix} \mid b_1b_4 \neq b_2b_3 \right\}$ , then  $G = A \times B$ .

**Definition 5.** A subgroup  $H$  of  $G$  is called a maximal subgroup if  $H$  is not contained in any other proper subgroup of  $G$ . i.e. If  $H \leq K \leq G$ , then  $K = G$  or  $K = H$ .

**Definition 6.** Subgroups of  $\text{Sym}(\Omega)$  are called permutation groups. Let  $G \leq \text{Sym}(\Omega)$ . Then  $G$  is transitive on  $\Omega$  if for all  $\alpha, \beta \in \Omega$  there exists  $\gamma \in G$  such that  $\alpha^\gamma = \beta$ . Otherwise  $G$  is intransitive.

**Homework 7.** (1). Let  $G = S_n$ . Describe maximal intransitive subgroups of  $G$ .

(2). Let  $G = \text{GL}_n(\mathbb{F}_p)$ . Describe maximal subgroups of  $G$  which fixes a 1 dimensional subspace of  $\mathbb{F}_p^n$ .

Let  $G$  be a cyclic group of order  $n$ . Then  $G$  is generated by a single element  $g$ . i.e.  $G = \langle g \rangle = \mathbb{Z}_n$ .

(1). If  $n = lm$  s.t.  $\gcd(l, m) = 1$ , then  $\mathbb{Z}_n = \mathbb{Z}_l \times \mathbb{Z}_m$ .

(2). If  $n = p_1^{e_1} \dots p_r^{e_r}$ , then  $\mathbb{Z}_n = \mathbb{Z}_{p_1^{e_1}} \times \dots \times \mathbb{Z}_{p_r^{e_r}}$ .

**Theorem 8.** Let  $G$  be a group of order  $p^2$ , where  $p$  is a prime number. Then either  $G \simeq \mathbb{Z}_{p^2}$  or  $G \simeq \mathbb{Z}_p \times \mathbb{Z}_p$ . In particular  $G$  is abelian.

证明. Let  $G$  be a group of order  $p^2$ .  $e \neq g \in G$  has order  $p$  or  $p^2$ . If  $g$  has order  $p^2$ , then  $G = \langle g \rangle$ . Suppose  $G$  does not have elements of order  $p^2$ . Let  $a \in G - e$ . Then  $\langle a \rangle \simeq \mathbb{Z}_p$ . Let  $b \in G - \langle a \rangle$ . Then  $\langle b \rangle \simeq \mathbb{Z}_p$ . Furthermore  $\langle a \rangle \cap \langle b \rangle = \{e\}$ . Then  $G \simeq \langle a \rangle \times \langle b \rangle \simeq \mathbb{Z}_p \times \mathbb{Z}_p$ .  $\square$

**Homework 9.** Prove  $G \simeq \langle a \rangle \times \langle b \rangle \simeq \mathbb{Z}_p \times \mathbb{Z}_p$ .

**Theorem 10.** (Fundamental Theorem of Finite Abelian Groups) Let  $G$  be a finite abelian group of order  $n$ . Let  $n = p_1^{e_1} \dots p_r^{e_r}$ . Then:

(1).  $G = G_1 \times \dots \times G_r$  where  $|G_i| = p_i^{e_i}$ .

(2).  $G$  is a direct product of cyclic groups.

证明. (1). Let  $n = p^e m$  s.t.  $p$  is a prime and  $(p, m) = 1$ . Let  $H = \{g^m | g \in G\}$ . Then  $H$  is a subgroup and every element of  $H$  has order  $p$ -power. Moreover  $|H| = p^e$ , and  $G = H \times K$  where  $K$  has order  $m$ . By induction  $K$  we can prove (1).

(2). Assume that  $|G| = p^e$ . Let  $g \in G$  which has the largest order. i.e.  $|g| \leq |h|$  for any  $h \in G$ . If  $G = \langle g \rangle$ , we are done. Suppose  $G \neq \langle g \rangle$ . Claim:  $G = \langle g \rangle \times H$  for some  $H < G$ . Let  $h \in G - \langle g \rangle$  s.t.  $h^p \in \langle g \rangle$ , so  $h^p = g^k$  for some integer  $k$ . Since  $|g| \leq |h|$ ,  $k = pl$ . Let  $x = h^{-1}g^l$ . Then  $|x| = p$  as  $x^p = h^{-p}g^{lp} = 1$ . And  $x \notin \langle g \rangle$ .

Let  $\bar{G} = G / \langle h \rangle$ . Then  $|\bar{G}| \leq |G|$ . By induction we may assume  $\bar{G} = \langle \bar{g} \rangle \times \bar{H}$ , where  $\bar{g}$  is the image of  $g$  in  $\bar{G}$ , and  $|\bar{g}| = |g|$  is the largest order in  $\bar{G}$ .

Let  $H$  be the full preimage of  $\bar{H}$  under  $\pi : G \rightarrow \bar{G}$ , i.e.  $H = \{h \in G | \bar{h} \in \bar{H}\}$ . Then  $H < G$  and  $H \cap \langle g \rangle = \{e\}$ . Thus  $G = \langle g \rangle H = \langle g \rangle \times H$ , as claimed.  $\square$
